This is a pretty disseminated approach - can't tell if the STELLA model parts are connected together. It looks like they'd have to assemble results of a variety of different models in order to reach any conclusions. This can work but there are likely to be issues with compatibility (e.g., are the linkages between the models manual or automated or both), synchronization (e.g., are water and sediment concentrations from the same place at the same time), and access (i.e., all the different modelers have to be on about the same schedule). Seems like a scale-up of the workable but labor intensive approach Windward took to the food web model comparisons.

This is Carl S's PP presentation on his F&T model that Eric mentioned in this AM's mtg.

Subject: Fate and Transport Presentation

While I was looking for the Juvenile Chinook tissue data I came across the contaminant fate and transport presentation that we received from the LWG a few weeks back. Not sure if it adds any value.

Eric
